

Adjustment and Scale-Up Strategy of Pilot Liquid Fermentation Process of *Azotobacter* sp.

Authors : G. Quiroga-Cubides, A. Díaz, M. Gómez

Abstract : The genus *Azotobacter* has been widely used as bio-fertilizer due to its significant effects on the stimulation and promotion of plant growth in various agricultural species of commercial interest. In order to obtain significantly viable cellular concentration, a scale-up strategy for a liquid fermentation process (SmF) with two strains of *A. chroococcum* (named Ac1 and Ac10) was validated and adjusted at laboratory and pilot scale. A batch fermentation process under previously defined conditions was carried out on a biorreactor Infors, model Minifors of 3.5 L, which served as a baseline for this research. For the purpose of increasing process efficiency, the effect of the reduction of stirring speed was evaluated in combination with a fed-batch-type fermentation laboratory scale. To reproduce the efficiency parameters obtained, a scale-up strategy with geometric and fluid dynamic behavior similarities was evaluated. According to the analysis of variance, this scale-up strategy did not have significant effect on cellular concentration and in laboratory and pilot fermentations (Tukey, $p > 0.05$). Regarding air consumption, fermentation process at pilot scale showed a reduction of 23% versus the baseline. The percentage of reduction related to energy consumption reduction under laboratory and pilot scale conditions was 96.9% compared with baseline.

Keywords : *Azotobacter chroococcum*, scale-up, liquid fermentation, fed-batch process

Conference Title : ICBCP 2016 : International Conference on Biological and Chemical Processes

Conference Location : Madrid, Spain

Conference Dates : March 26-27, 2017
