

An Extraction of Cancer Region from MR Images Using Fuzzy Clustering Means and Morphological Operations

Authors : Ramandeep Kaur, Gurjit Singh Bhathal

Abstract : Cancer diagnosis is very difficult task. Magnetic resonance imaging (MRI) scan is used to produce image of any part of the body and provides an efficient way for diagnosis of cancer or tumor. In existing method, fuzzy clustering mean (FCM) is used for the diagnosis of the tumor. In the proposed method FCM is used to diagnose the cancer of the foot. FCM finds the centroids of the clusters of the foot cancer obtained from MRI images. FCM thresholding result shows the extract region of the cancer. Morphological operations are applied to get extracted region of cancer.

Keywords : magnetic resonance imaging (MRI), fuzzy C mean clustering, segmentation, morphological operations

Conference Title : ICACSE 2014 : International Conference on Applied Computer Science and Engineering

Conference Location : Berlin, Germany

Conference Dates : May 22-23, 2014
