

## Intellectual Property Protection of CRISPR Related Technologies

**Authors :** Zheng Miao, Dennis Fernandez

**Abstract :** CRISPR research has the potential to completely transform life science, agriculture, live-stock and the health care industry. The Intellectual Property derived from its research has raised significant attention in the academic as well as the biopharmaceutical industry culminating an urgent need for strategic IP protection. We review the rudimentary concepts and key competitors of CRISPR technologies as well as the paramount strategies for intellectual property protection. Further, we elaborate on prosecution issues related to CRISPR patents as well as possible solutions to various patent laws, interferences and litigation. Finally, we address how the bioinformatics of the CRISPR technology begs an inquiry into issues of privacy and a host of ethical concerns.

**Keywords :** bioinformatics, CRISPR, biotechnology, intellectual property

**Conference Title :** ICBBBE 2017 : International Conference on Bioengineering, Biochemical and Biomedical Engineering

**Conference Location :** Havana, Cuba

**Conference Dates :** November 23-24, 2017
