

Processing Big Data: An Approach Using Feature Selection

Authors : Nikat Parveen, M. Ananthi

Abstract : Big data is one of the emerging technology, which collects the data from various sensors and those data will be used in many fields. Data retrieval is one of the major issue where there is a need to extract the exact data as per the need. In this paper, large amount of data set is processed by using the feature selection. Feature selection helps to choose the data which are actually needed to process and execute the task. The key value is the one which helps to point out exact data available in the storage space. Here the available data is streamed and R-Center is proposed to achieve this task.

Keywords : big data, key value, feature selection, retrieval, performance

Conference Title : ICASME 2017 : International Conference on Administrative Science and Management Engineering

Conference Location : Miami, United States

Conference Dates : December 14-15, 2017
