

In vitro Plant Regeneration of *Gonystylus Bancanus* (Miq) Kurz. Through Direct Organogenesis

Authors : Grippin Akeng, Suresh Kumar Muniandy, Nor Aini Ab Shukor

Abstract : Plant regeneration was achieved from shoot tip and nodal segment of *Gonystylus bancanus* (Miq) Kurz. cultured in Murashige and Skoog's medium supplemented with various concentrations of 6-benzylaminopurine (BAP). The most optimum concentration of BAP for shoot initiation is 10.0 mg l^{-1} with approximately 10% of shoot tip and 15% of nodal segment produced single shoot after 28 and 15 days of culture incubation respectively. Rooting was achieved when shoots were transferred into MS medium supplemented with 5.0 mg l^{-1} Naphthalene acetic acid (NAA). Synthesizing results developed through this research can be a starting point for the upscaling and optimization process in future.

Keywords : gonystylus bancanus, organogenesis, shoot initiation, shoot tip

Conference Title : ICPTCPB 2017 : International Conference on Plant Tissue Culture and Plant Biotechnology

Conference Location : Bangkok, Thailand

Conference Dates : November 29-30, 2017
