A Study on the Impacts of Computer Aided Design on the Architectural Design Process

Authors : Halleh Nejadriahi, Kamyar Arab

Abstract : Computer-aided design (CAD) tools have been extensively used by the architects for the several decades. It has evolved from being a simple drafting tool to being an intelligent architectural software and a powerful means of communication for architects. CAD plays an essential role in the profession of architecture and is a basic tool for any architectural firm. It is not possible for an architectural firm to compete without taking the advantage of computer software, due to the high demand and competition in the architectural industry. The aim of this study is to evaluate the impacts of CAD on the architectural design process from conceptual level to final product, particularly in architectural practice. It examines the range of benefits of integrating CAD into the industry and discusses the possible defects limiting the architects. Method of this study is qualitatively based on data collected from the professionals' perspective. The identified benefits and limitations of CAD on the architectural design process will raise the awareness of professionals on the potentials of CAD and proper utilization of that in the industry, which would result in a higher productivity along with a better quality in the architectural offices. **Keywords :** architecture, architectural practice, computer aided design (CAD), design process

Conference Title : ICAACAD 2017 : International Conference on Advantages of Architectural Computer Aided Design **Conference Location :** Vancouver, Canada

1

Conference Dates : August 07-08, 2017
