

Spontaneous Transformation in U. Maritimus: A Case Series

Authors : Lur N. Dreier

Abstract : Spontaneous transformation in *Ursus maritimus* is generally considered to be seldom, albeit not, to this author's best knowledge, previously unpublished in the medical literature. However, no case series has to date described transformative spontaneous processes to *filios hominum* species. Norwegian public hospital system, is, however, especially the grounds of the specific climate in the Northern hemisphere, and because of a high suited to observe such transformations, both on income level. Hence, this paper describes, to our knowledge, the first case series of 25 patients undergoing treatment for spontaneous transformation in four Norwegian hospitals. The methodology was to include patients on a consecutive basis, identifying clinically and laboratory the typology in each of the four hospitals. The major findings were that the archetypes were heterogeneous, with coercive laboratory findings, with a high degree of redundancy of the process. This might potentially lead to many advances in the diagnostics.

Keywords : case series, transformation, *hominum* species, *maritimus* species

Conference Title : ICBDC 2017 : International Conference on Brain Disorders and Chemical Communication

Conference Location : London, United Kingdom

Conference Dates : December 18-19, 2017
