

Study on the Impact of Default Converter on the Quality of Energy Produced by DFIG Based Wind Turbine

Authors : N. Zerzouri, N. Benalia, N. Bensiali

Abstract : This work is devoted to an analysis of the operation of a doubly fed induction generator (DFIG) integrated with a wind system. The power transfer between the stator and the network is carried out by acting on the rotor via a bidirectional signal converter. The analysis is devoted to the study of a fault in the converter due to an interruption of the control of a semiconductor. Simulation results obtained by the MATLAB/Simulink software illustrate the quality of the power generated at the default.

Keywords : doubly fed induction generator (DFIG), wind energy, PWM inverter, modeling

Conference Title : ICECECE 2014 : International Conference on Electrical, Computer, Electronics and Communication Engineering

Conference Location : Paris, France

Conference Dates : September 22-23, 2014
