

Ologen Collagen Matrix Implant in Uveitis Induced Glaucoma with Temporal Trabeculectomy

Authors : Ritesh Verma, Manisha Rath, Chand Singh Dhull, Sumit Sachdeva, Jitender Phogat

Abstract : Temporal trabeculectomy with the Ologen implant was done in a 66-year-old lady with uveitic glaucoma. Serial IOP measurement was done to assess the efficacy of ologen implant in uveitic glaucoma. The patient had an IOP of 4mmhg day 1 postoperatively and Ologen implant was in place with a well-formed bleb. On follow up patient had an IOP of 14mmhg and unaided visual acuity of 6/12 on day 10 postoperatively. After 12 weeks of Trabeculectomy with Ologen implant, the IOP of the patient was 14 mmHg, the vision was 6/6 with -1.25 DS and -1.25 DC at 90 degrees. Trabeculectomy performed in patients with uveitic glaucoma has a higher chance of failure due to increased inflammation and fibrosis. Trabeculectomy with ologen implant done in a patient of uveitic glaucoma provides excellent postoperative results and the patient has a well-controlled IOP even after 56 weeks of surgery and a best corrected visual acuity of 6/6. Trabeculectomy with the ologen implant is superior to other surgeries in cases of secondary glaucoma with increased inflammation.

Keywords : glaucoma surgery, ologen implant, temporal trabeculectomy, uveitic glaucoma

Conference Title : ICOGT 2018 : International Conference on Ophthalmology and Glaucoma Treatments

Conference Location : Singapore, Singapore

Conference Dates : January 08-09, 2018
