

Major Incident Tier System in the Emergency Department: An Approach

Authors : Catherine Bernard, Paul Ransom

Abstract : Recent events have prompted emergency planners to re-evaluate their emergency response to major incidents and mass casualties. At the Royal Sussex County Hospital, we have adopted a tiered system comprised of three levels, anticipating an increasing P1, P2 or P3 load. This will aid planning in the golden period between Major Incident 'Standby,' and 'Declared'. Each tier offers step-by-step instructions on appropriate patient movement within and out of the department, as well as suggestions for overflow areas and additional staffing levels. This system can be adapted to individual hospitals and provides concise instructions to be followed in a potentially overwhelming situation.

Keywords : disaster planning, emergency preparedness, major incident planning, mass casualty event
