

Usability Issues of Smart Phone Applications: For Visually Challenged People

Authors : Anam Ashraf, Arif Raza

Abstract : In this era of globalization, adoption of technology is quite difficult for people with physical disabilities compared to people with normal abilities. The advancement in mobile based accessible applications has opened up several different avenues for the visually challenged across the globe. Smartphones applications are not very common for blind people, but they access and use these applications in their daily lives to some extent. Several smartphone applications have a number of usability issues for the visually impaired. In this paper, we evaluate the usability of various android and iPhone applications for blind people through analysis and surveys. This paper aspires to provide guidance in order to increase smartphone application accessibility for the visually impaired. An abstract application design is also proposed to overcome usability issues in smartphone applications for visually challenged people.

Keywords : eyes-free shell, human computer interaction, usability engineering, visually challenged

Conference Title : ICHCI 2014 : International Conference on Human-Computer Interaction

Conference Location : Amsterdam, Netherlands

Conference Dates : May 15-16, 2014
